Check it yourself

Status: PENDING

Prepared by AI as a review aid. It records no review. It validates nothing until a named person does the work and writes down their own findings. Answers are in a separate AI-prepared key, so keep that closed until you have your own result.

Use a calculator, a spreadsheet or code you wrote. Check inputs against the named original file, not just this sheet. Disagreeing with the proposal is a valid finding.

A. One-day return, 29 October 2026

From `weights_before_min_variance.csv` and the active `simple_returns.parquet`. Multiply each weight by its return and add them up.

ETF	Pre-return weight	Asset return
SPY	0.2072522004	−0.0038197255
EFA	0.0000000000	0.0064621737
EEM	0.0000000000	−0.0125944463
AGG	0.3988026610	0.0027114625
GLD	0.2401612921	−0.0132258904
XLE	0.1537838464	0.0037984244
XLK	0.0000000000	−0.0118324320

Your answer: _____

B. Evaluation maximum drawdown

From `daily_performance.csv`, `min_variance`, from 4 January 2021. Compound `net_return` from wealth 1, include that start in the running peak, and find the deepest fall.

Your answer, with peak and trough dates: _____

C. Recent Normal VaR at 99%

Last 1,260 returns at `current_weights.min_variance`. Compute mean loss + quantile × standard deviation.

- Mean loss: −0.00041620720369139
- Standard deviation, ddof = 1: 0.00573420629040984
- Standard Normal 99% quantile: 2.3263478740408408

Your answer: _____

D. Recent Historical ES at 99%

The worst 1% of 1,260 sessions is 12.6 sessions of mass. Worst 13 losses, largest first:

0.0308629607, 0.0285272134, 0.0248119537, 0.0209231043, 0.0202649687, 0.0190714417, 0.0190398371, 0.0182378841, 0.0180522413, 0.0160109658, 0.0155177994, 0.0154354104, 0.0153949820

Compute (sum of the first 12 + 0.6 × the 13th) ÷ 12.6.

Your answer: _____

E. GFC endpoint at the current target

9 October 2007 to 9 March 2009, buy and hold. Multiply each weight by its cumulative return, add them up, and give the USD result on $10,000,000.

ETF	Current target	Cumulative return
SPY	0.2039227295	−0.5476743002
EFA	0.0000000000	−0.5978555404
EEM	0.0000000000	−0.5850587914
AGG	0.4000000000	0.0716563681
GLD	0.2500000000	0.2487246825
XLE	0.1460772705	−0.4686534254
XLK	0.0000000000	−0.5103941499

Your answer and USD: _____

F. Return hurdle

$1 + R - s - f = (1 + \pi)(1 + g)$ with spending 4%, fee 0.25%, inflation 2.5% and real growth 0%.

Your answer: _____

Record what you actually did

Complete one form per reviewer. Leave a field blank if the work was not done. Do not fill this in for someone else.
